

CERME9

Proceedings of the Ninth Congress of the European Society for Research in Mathematics Education

Editors: Konrad Krainer, Nad'a Vondrová
Organized by: Charles University in Prague,
Faculty of Education

e r m e
european society for
research in
mathematics
education

Editors: Konrad Krainer, Nad'a Vondrová

Editorial Board: Paul Andrews, Samuele Antonini, Véronique Battie, Berta Barquero, Irene Biza, Lisa Björklund Boistrup, Marianna Bosch, Marc Bosse, Laurinda Brown, Orly Buchbinder, Mariolina Bartolini Bussi, Susana Carreira, Sona Ceretkova, Charalambos Charalambous, Aurélie Chesnais, Yves Chevallard, Renaud Chorlay, Anna Chronaki, Kathy Clark, Alison Clark-Wilson, Andreas Eichler, Lisser Rye Ejersbo, Ingvald Erfjord, Lourdes Figueiras, Inés Maria Gómez-Chacón, Alejandro González-Martín, Simon Goodchild, Ghislaine Gueudet, Corinne Hahn, Jeremy Hodgen, Alena Hospesova, Paola Iannone, Eva Jablonka, Arne Jakobsen, Uffe Thomas Jankvist, Darina , Jirotková, Gabriele Kaiser, Alexander Karp, Sibel Kazak, Ivy Kidron, Iveta Kohanová, Eugenia Koleza, Snezana Lawrence, Aisling Leavy, Roza Leikin, Esther Levenson, Peter Liljedahl, Thomas Lingefjord, Matija Lokar, Jan van Maanen, Božena Maj-Tatsis, Nicolina Malara, Mirko Maracci, Michela Maschietto, Pietro Di Martino, Heidi Strømskag Måsøval, Tamsin Meaney, Julia Meinke, Mônica Mesquita, Joris Mithalal, John Monaghan, Francesca Morselli, Reidar Mosvold, Elena Nardi, Reinhard Oldenburg, Hanna Palmér, Demetra Pitta Pantazi, Marilena Pantziara, Kirsten Pfeiffer, Núria Planas, Valentina Postelnicu, Despina Potari, Caterina Primi, Elisabeth Rathgeb-Schnierer, Sebastian Rezat, Miguel Ribeiro, Philippe R. Richard, Ornella Robutti, Bettina Rösken-Winter, Frode Rønning, Charalambos Sakonidis, Stanislaw Schukajlow, Marcus Schütte, Nathalie Sinclair, Florence Mihaela Singer, Jeppe Skott, Hauke Straehler-Pohl, Gabriel Stylianides, Jana Trgalova, Fatma Aslan Tutak, Olov Viirman, Geoff Wake, Hans-Georg Weigand, Carl Winsløw, Constantinos Xenofontos, Stefan Zehetmeier

Publisher: Charles University in Prague, Faculty of Education and ERME

Place: Prague, Czech Republic

Year: 2015

ISBN: 978-80-7290-844-8

Table of Contents

1	PREFACE		
2	Preface <i>Viviane Durand-Guerrier, Susanne Prediger</i>		
4	Editorial information <i>Konrad Krainer and Nad'a Vondrová</i>		
6	PLENARY LECTURES		
7	Cultural contexts for European research and design practices in Mathematics Education <i>Barbara Jaworski, Maria G. Bartolini Bussi, Susanne Prediger and Edyta Nowinska</i>		
34	Understanding randomness: Challenges for research and teaching <i>Carmen Batanero</i>		
50	Research in teacher education and innovation at schools: Cooperation, competition or two separate worlds? <i>Jarmila Novotná</i>		
66	TWG01 ARGUMENTATION AND PROOF		
67	Introduction to the papers of TWG01: Argumentation and proof <i>Samuele Antonini, Orly Buchbinder, Kirsten Pfeiffer and Gabriel J. Stylianides</i>		
71	Research papers		
72	Proof by reductio ad absurdum: An experience with university students <i>Angelina Alvarado Monroy and María Teresa González Astudillo</i>		
79	Proof writing at undergraduate level <i>Nadia Azrou</i>		
86	On a generality framework for proving tasks <i>Andreas Bergwall</i>		
93	Analyzing the transition to epsilon-delta Calculus: A case study <i>Paolo Boero</i>		
100	Pre-service teachers' construction of algebraic proof through exploration of math-tricks <i>Orly Buchbinder and Alice Cook</i>		
107	A case study: how textbooks of a Spanish publisher justify results related to limits from the 70's until today <i>Laura Conejo, Matias Arce and Tomás Ortega</i>		
114	Argumentation below expectation: a double-threefold Habermas explanation <i>Jenny Christine Cramer</i>		
121	Is the use of GeoGebra advantageous in the process of argumentation? <i>Özlem Erkek and Mine Işıkşal-Bostan</i>		
128	Constructing validity in classroom conversations <i>Manuel Goizueta and Maria Alessandra Mariotti</i>		
135	Pre-service teachers' perceptions of generic proofs in elementary number theory <i>Leander Kempen and Rolf Biehler</i>		
142	Disparate arguments in mathematics classrooms <i>Christine Knipping, Daniela Rott and David A Reid</i>		
149	E-assessment of understanding of geometric proofs using interactive diagrams <i>Yael Luz and Michal Yerushalmy</i>		
156	Building stories in order to reason and prove in mathematics class in primary school <i>Marianne Moulin and Virginie Deloustal-Jorrand</i>		
164	The genesis of proof in ancient Greece: The pedagogical implications of a Husserlian reading <i>Andreas Moutsios-Rentzos and Panagiotis Spyrou</i>		
171	Discriminating proof abilities of secondary school students with different mathematical talent <i>Juan Antonio Moya, Angel Gutiérrez and Adela Jaime</i>		
178	Proof evaluation tasks as tools for teaching? <i>Kirsten Pfeiffer and Rachel Quinlan</i>		
185	Mathematical fit: A first approximation <i>Manya Raman-Sundström and Lars-Daniel Öhman</i>		
192	Students of two-curriculum types Performance on a proof for congruent triangles <i>Ruthmae Sears and Óscar Chávez</i>		
198	A theoretical perspective for proof construction <i>Annie Selden and John Selden</i>		
205	Textbook explanations: Modes of reasoning in 7 th grade Israeli mathematics textbooks <i>Boaz Silverman and Ruhama Even</i>		
213	The role of mode of representation in students' argument constructions <i>Andreas J. Stylianides</i>		
221	Posters		
222	Considerations on teaching methods to deepen student argumentation through problem solving activities <i>Tsutomu Ishii</i>		
224	Unpack and repack mathematical activity with pre-service teachers: A research project <i>Simon Modeste and Francisco Rojas</i>		
226	How is proving constituted in Cypriot classroom? <i>Maria Pericleous</i>		

228	Four steps on the way to create argumentation competence supported by technology <i>Evelyn Süss-Stepancik and Stefan Götz</i>	324	The rules for the order of operations: the case of an inservice teacher <i>Ioannis Papadopoulos</i>
230	An example of Proof-Based Teaching: 3 rd graders constructing knowledge by proving <i>Estela Vallejo Vargas and Candy Ordoñez Montañez</i>	331	Cracking percent problems in different formats: The role of texts and visual models for students with low and high language proficiency <i>Birte Pöhler, Susanne Prediger and Henrike Weinert</i>
232	TWG02 ARITHMETIC AND NUMBER SYSTEMS	339	Cognitive flexibility and reasoning patterns in American and German elementary students when sorting addition and subtraction problems <i>Elisabeth Rathgeb-Schnierer and Michael Green</i>
233	Introduction to the papers of TWG02: Arithmetic and number systems <i>Sebastian Rezat, Lisser Rye Ejersbo, Darina Jirotkova and Elisabeth Rathgeb-Schnierer</i>	346	A network of notions, concepts and processes for fractions and rational numbers as an interpretation of Didactical Phenomenology <i>Rubí Real and Olimpia Figueras</i>
237	Research papers	354	Flexible mental calculation and "Zahlenblickschulung" <i>Charlotte Rechtsteiner-Merz and Elisabeth Rathgeb-Schnierer</i>
238	A study on the changes in the use of number sense in secondary students <i>Rut Almeida and Alicia Bruno</i>	361	Foundational number sense: Summarising the development of an analytical framework <i>Judy Sayers and Paul Andrews</i>
245	Student strategies and errors in mental computation with rational numbers in open number sentences <i>Renata Carvalho and João Pedro da Ponte</i>	368	Additive adaptive thinking in 1st and 2nd grades pupils <i>Lurdes Serrazina and Margarida Rodrigues</i>
252	Spatial structuring, enumeration and errors of S.E.N. students working with 3D arrays <i>Carla Finesilver</i>	375	Improving classroom assessment in primary mathematics education in the Netherlands <i>Michiel Veldhuis and Marja van den Heuvel-Panhuizen</i>
259	Computing by counting in first grade: It ain't necessarily so <i>Michael Gaidoschik, Anne Fellmann and Silvia Guggenbichler</i>	382	Posters
266	What is a better buy? Rationale and empirical analysis of unequal ratios tasks in commercial offers contexts <i>Bernardo Gómez and Amparo García</i>	383	A socially built understanding of rational numbers <i>Helena Gil Guerreiro and Lurdes Serrazina</i>
274	Replacing persistent counting strategies with cooperative learning <i>Uta Häsel-Weide</i>	385	TWG03 ALGEBRAIC THINKING
281	Students' argumentation schemes in terms of solving tasks with negative numbers <i>Mathias Hattermann and Rudolf vom Hofe</i>	386	Introduction to the papers of TWG03: Algebraic thinking <i>Jeremy Hodgen, Reinhard Oldenburg, Valentina Postelnicu and Heidi Strømskag</i>
288	Reversible and irreversible desemantization <i>Milan Hejny, Darina Jirotková and Jana Slezáková</i>	390	Research papers
295	Sixth grade students' explanations and justifications of distributivity <i>Kerstin Larsson</i>	391	Flexible algebraic action on quadratic equations <i>Jan Block</i>
302	Investigating fourth graders' conceptual understanding of computational estimation using indirect estimation questions <i>Sabrina Lübke</i>	398	Connections between algebraic thinking and reasoning processes <i>Maria Chimoni and Demetra Pitta-Pantazi</i>
309	The impact of a teaching intervention on sixth grade students' fraction understanding and their performance in seven abilities that constitute fraction understanding <i>Aristoklis A. Nicolaou and Demetra Pitta-Pantazi</i>	405	Which algebraic learning can a teacher promote when her teaching does not focus on interpretative processes? <i>Annalisa Cusi and Nicolina A. Malara</i>
316	Processes of mathematical reasoning of equations in primary mathematics lessons <i>Marcus Nührenböcker and Ralph Schwarzkopf</i>	412	Does bodily movement enhance mathematical problem solving? Behavioral and neurophysiological evidence <i>Diana Henz, Reinhard Oldenburg and Wolfgang I. Schöllhorn</i>
		419	Solving equations: Gestures, (un)allowable hints, and the unsayable matter <i>Thomas JanBen and Luis Radford</i>

426	Algebraic reasoning levels in primary and secondary education <i>Juan D. Godino, Teresa Neto, Miguel R. Wilhelm, Lilia Aké, Silvia Etcheagaray and Aitzol Laso</i>	510	TWG04 GEOMETRICAL THINKING
433	Using variation theory to design tasks to support students' understanding of logarithms <i>AnnMarie H. O'Neil and Helen M. Doerr</i>	511	Introduction to the papers of TWG04: Geometrical Thinking <i>Sona Ceretkova, Aurélie Chesnais, Michela Maschietto, Joris Mithalal-Le Doze, Philippe R. Richard and Ewa Swoboda</i>
440	Teaching the concept of function: Definition and problem solving <i>Areti Panaoura, Paraskevi Michael-Chrysanthou and Andreas Philippou</i>	514	Research papers
446	The development of student's early number sense <i>Marios Pittalis, Demetra Pitta-Pantazi and Constantinos Christou</i>	515	Prospective teachers' development of geometric reasoning through an exploratory approach <i>Lina Brunheira and João Pedro da Ponte</i>
453	College students' understanding of parameters in algebra <i>Valentina Postelnicu and Florin Postelnicu</i>	522	Articulation between students' and teacher's activity during sessions about line symmetry <i>Aurélie Chesnais and Anne-Cécile Mathé</i>
460	Analysing Ireland's Algebra Problem <i>Mark Prendergast and Paraic Treacy</i>	529	Teaching geometry to students (from five to eight years old) <i>Jacques Douaire and Fabien Emprin</i>
467	How much space for communication is there for a low achieving student in a heterogeneous group? <i>Anita Movik Simensen, Anne Berit Fuglestad and Pauline Vos</i>	536	The level of understanding geometric measurement <i>Eszter Herendiné-Kónya</i>
474	A pattern-based approach to elementary algebra <i>Heidi Strømskag</i>	543	Using the geometric working spaces to plan a coherent teaching of geometry <i>Alain Kuzniak and Assia Nechache</i>
481	A study of the preparation of the function concept <i>Gyöngyi Szanyi</i>	550	Spatial and geometric structuring – contributions for a collective construction <i>Cristina Loureiro and Lurdes Serrazina</i>
488	The development and arithmetic foundations of early functional thinking <i>Ulises Xolocotzin and Teresa Rojano</i>	557	Combining epistemological and cognitive approaches of geometry with cKc <i>Joris Mithalal-Le Doze</i>
495	Posters	564	Working with visually impaired students: Strategies developed in the transition from 2D geometrical objects to 3D geometrical objects <i>Chrysi Papadaki</i>
496	Windows on students' algebra: Describing their habits of mind <i>Deniz Eroğlu and Dilek Tanişli</i>	571	Learning geometry through paper-based experiences <i>Marta Pytlak</i>
498	Middle grade teachers' thinking of algebraic reasoning in relation to their classrooms <i>David Glassmeyer and Belinda Edwards</i>	578	Six year old pupils' intuitive knowledge about triangles <i>Maria Paula Rodrigues and Maria de Lurdes Serrazina</i>
500	Developing the notions of variation and covariation through patterns: An institutional analysis of primary school textbooks <i>Eudes Libert Mamas Mavoungou and Alejandro S. González-Martín</i>	584	Mathematization of rotation as a didactic task <i>Ewa Swoboda</i>
502	Creative reasoning more beneficial for cognitively weaker students <i>Mathias Norqvist, Johan Lithner, Bert Jonsson and Yvonne Liljekvist</i>	591	The meaning of isometries as function of a set of points and the process of understanding of geometric transformation <i>Xhevdet Thaqi, Joaquim Gimenez and Ekrem Aljimi</i>
504	Prototypes in secondary and university mathematical education <i>Derek Pilous and David Janda</i>	598	A meta-classification for students' selections of quadrilaterals: The case of trapezoid <i>Fadime Ulusoy</i>
506	Generalising from visual spatial patterns <i>Aisling Twohill</i>	605	Posters
508	Teachers' procedures when introducing algebraic expression in two Norwegian grade 8 classrooms <i>Unni Wathne</i>	606	Signs and validation in the teaching of geometry at the end of compulsory schooling in France: A case analysis <i>Assia Nechache</i>
		608	Development of preservice teachers' content knowledge in geometrical transformations: A teaching experiment <i>Candas Uygan, Nilufer Y. Kose and Dilek Tanisli</i>

610	TWG05 PROBABILITY AND STATISTICS EDUCATION	715	Analysing teachers' knowledge about sampling using TinkerPlots 2.0 <i>Maria Niedja Martins, Carlos Monteiro and Carolina Carvalho</i>
611	Introduction to the papers of TWG05: Probability and statistics education <i>Corinne Hahn, Andreas Eichler, Sibel Kazak, Aisling Leavy and Caterina Primi</i>	722	Intuition about concept of chance in elementary school children <i>Jasmina Milinković</i>
614	Research papers	727	Making sense of statistical and probabilistic information in the media texts: Pre-service teachers' critical thinking processes <i>Mehtap Ozen and Erdinc Cakiroglu</i>
615	Studying the process of transforming a statistical inquiry-based task in the context of a teacher study group <i>Dionysia Bakogianni</i>	734	An interview study on reading statistical representations in biology education <i>Christine Plicht, Markus Vogel and Christoph Randler</i>
622	Gender differences in attitudes toward statistics: Is there a case for a confidence gap? <i>Francesca Chiesi and Caterina Primi</i>	740	Interest in statistics: Examining the effects of individual and situational characteristics <i>Maria Anna Donati, Caterina Primi, Francesca Chiesi and Kinga Morsanyi</i>
629	Enactive metaphoric approaches to randomness <i>Daniela Díaz-Rojas and Jorge Soto-Andrade</i>	746	Affective exhibition during the interpretation of statistical data <i>Tamires Queiroz, Carlos Monteiro, Liliane Carvalho and Karen François</i>
636	Aspects of students' changing mental models when acting within statistical situations <i>Andreas Eichler and Markus Vogel</i>	754	Individual concepts of students comparing distributions <i>Susanne Schnell and Christian Büscher</i>
643	Preservice teachers' statistical reasoning when comparing groups facilitated by software <i>Daniel Frischemeier and Rolf Biehler</i>	761	Changing beliefs about the benefit of statistical knowledge <i>Alexandra Sturm and Andreas Eichler</i>
651	An investigation of understanding of preservice elementary mathematics teachers (PEMT) about data displays <i>Kurt Gamze</i>	768	Posters
658	Regression in high school: An empirical analysis of Spanish textbooks <i>María M. Gea, Carmen Batanero, Pedro Arteaga, J. Miguel Contreras and Gustavo R. Cañadas</i>	769	Understanding the knowledge demands of teaching statistics: Insights gained from examining practice <i>Aisling Leavy</i>
665	Mathematics teachers' conceptions of how to promote decision-making while teaching statistics: The case of Japanese secondary school teachers <i>Orlando González</i>	771	Developing statistical literacy: The case of graphs with preservice teachers <i>Ana Paula Canavarro</i>
672	Secondary education students' understanding of sampling <i>Gilda Lisbôa Guimarães and Tâmara Marques da Silva Gomes</i>	773	Statistical variability: Comprehension of children in primary school <i>Erica Cavalcanti and Gilda Guimarães</i>
678	Rolling the dice – exploring different approaches to probability with primary school students <i>Markus A. Helmerich</i>	775	Difficulties in learning statistics: An experiment with young children <i>Susana Colaço</i>
685	Students' informal inference when exploring a statistical investigation <i>Ana Henriques and Hélia Oliveira</i>	777	An obstacle to teaching hypothesis testing to future managers: The plurality of conceptions related to the concept of variable <i>Roxane Jallet-Cattan and Corinne Hahn</i>
692	Improving teachers' reasoning about sampling variability: A cross institutional effort <i>Bridgette L. Jacob, Hollylynne S. Lee, Dung Tran and Helen M. Doerr</i>	779	Students' beliefs about statistics: Lessons from a journalism statistics class <i>Dun Nkhoma Kasoka</i>
700	A Bayesian inspired approach to reasoning about uncertainty: 'How confident are you?' <i>Sibel Kazak</i>	781	Attitudes to statistics and affective expressions in use of graphs developed by primary school teachers <i>Maria Niedja Martins and Carolina Carvalho</i>
707	Simulation approaches for informal inference: Models to develop understanding <i>Hollylynne S. Lee, Dung Tran, Jennifer Nickell and Helen Doerr</i>	783	Analysis of teachers' attitudes towards statistics <i>José Alexandre Martins, Assumpta Estrada and Maria Nascimento</i>

785	The development of informal inferential reasoning via resampling <i>Jeffrey A. McLean and Helen M. Doerr</i>	876	Modelling: From theory to practice <i>Britta Eyrich Jessen, Tinne Hoff Kjeldsen and Carl Winsløw</i>
787	Core competencies for the professional use of applied statistics in business administration, how to promote them in the classroom? <i>Vanessa Serrano Molinero and Lucinio González-Sabaté</i>	883	Evaluating the effectiveness of a framework for measuring students' engagement with problem solving episodes <i>Patrick Johnson and Seán Moylett</i>
789	TWG06 APPLICATIONS AND MODELLING	890	Student's interpretations of visual models <i>Thomas Lingefjärd and Djamshid Farahani</i>
790	Introduction to the papers of TWG06: Applications and modelling <i>Susana Carreira, Berta Barquero, Gabriele Kaiser, Thomas Lingefjärd and Geoff Wake</i>	897	Differences in the situation model construction for a textbook problem: The broken tree or the broken bamboo? <i>José Antonio Juárez López, Josip Slisko Ignjatov, Lidia Aurora Hernández Rebolgar and Mónica Monroy Kuhn</i>
794	Research papers	904	Mathematical models for chemistry and biochemistry service courses <i>Victor Martínez-Luaces</i>
795	Mathematization and modelling of physical phenomena: Analysis of two proposals <i>Jose Benito Búa Ares, María Teresa Fernández Blanco and Rubén Figueroa Sestelo</i>	910	School mathematical modelling: Developing mathematics or developing modelling? <i>Chris Olley</i>
802	At the core of modelling: Connecting, coordinating and integrating models <i>Jonas Bergman Årlebäck and Helen M. Doerr</i>	917	Thought structures as an instrument to determine the degree of difficulty of modelling tasks <i>Xenia-Rosemarie Reit and Matthias Ludwig</i>
809	A study and research path on mathematical modelling for teacher education <i>Berta Barquero, Marianna Bosch and Avenilde Romo</i>	923	A multidisciplinary approach to model some aspects of historical events <i>Gemma Sala, Berta Barquero, Vicenç Font and Joaquim Giménez</i>
816	Mathematical modelling, problem solving, project and ethnomathematics: Confluent points <i>María Salett Biembengut</i>	930	The link between the cognitive structure and modelling to improve mathematics education <i>Laura van de Weerd and Nellie Verhoef</i>
821	Taxonomy of modelling tasks <i>Wolfgang Bock, Martin Bracke and Jana Kreckler</i>	937	Understanding issues in teaching mathematical modelling: Lessons from lesson study <i>Geoff Wake, Colin Foster and Malcolm Swan</i>
827	Conceptions in France about mathematical modelling: Exploratory research with design of semi-structured interviews <i>Richard Cabassut and Irene Ferrando</i>	944	Identifying ways to improve student performance on context-based mathematics tasks <i>Ariyadi Wijaya, Marja van den Heuvel-Panhuizen and Michiel Doorman</i>
834	Assessing the best staircase: Students' modelling based on experimentation with real objects <i>Susana Carreira and Ana Margarida Baioa</i>	951	'Literature' on mathematical modelling from a teacher perspective: A textbook's portrayal <i>Anders Wolfsberg</i>
841	Competing conceptual systems and their impact on generating mathematical models <i>Jennifer A. Czocher</i>	958	Posters
848	Exploring grade 9 students' assumption making when mathematizing <i>Brikena Djepaxhija, Pauline Vos and Anne Berit Fuglestad</i>	959	The Fraunhofer MINT-EC Math Talents Programme <i>Martin Bracke, Patrick Capraro, Jana Kreckler and Andreas Roth</i>
855	Fostering students' independence in modelling activities <i>Helen M. Doerr and Jonas B. Årlebäck</i>	961	A didactic problem around the elementary differential calculus and functional modelling <i>Catarina Lucas, Josep Gascón and Cecilio Fonseca</i>
862	One-sided limits of a function at a point in a drug metabolism context as explained by non-compulsory secondary students <i>José Antonio Fernández-Plaza, Luis Rico and Juan Francisco Ruiz-Hidalgo</i>	963	Learning the concept of family of functions through the modelling process using tablets <i>Miriam Ortega and Luis Puig</i>
869	A comparison between strategies applied by mathematicians and mathematics teachers to solve a problem <i>Carolina Guerrero-Ortiz and Jaime Mena-Lorca</i>		

965	TWG07 MATHEMATICAL POTENTIAL, CREATIVITY AND TALENT	1073	Problem posing: Students between driven creativity and mathematical failure <i>Florence Mihaela Singer, Ildikó Pelczer and Cristian Voica</i>
966	Introduction to the papers of TWG07: Mathematical potential, creativity and talent <i>Roza Leikin, Alexander Karp, Demetra Pitta-Pantazi and Florence Mihaela Singer</i>	1080	What can we learn from pre-service teachers' beliefs on and dealing with creativity stimulating activities? <i>Ilya Sinitzky</i>
969	Research papers	1087	Mathematical problem-solving by high-achieving students: Interaction of mathematical abilities and the role of the mathematical memory <i>Attila Szabo</i>
970	The impact of mathematics interest and attitudes as determinants in order to identify girls' mathematical talent <i>Ralf Benölken</i>	1094	Posters
977	Pre-service teachers' mathematical reasoning <i>Alv Birkeland</i>	1095	Problem solving competency and the mathematical kangaroo <i>Elisabet Mellroth</i>
983	Developing students' culture of problem solving via heuristic solving strategies <i>Jiří Bureš and Hana Nováková</i>	1097	Exploratory learning in the mathematical classroom (open-ended approach) <i>Ildar Safuanov, Sergey Atanasyan and Irina Ovsyannikova</i>
989	Looking for creativity in primary school mathematical tasks <i>Despina Desli and Marianthi Zioga</i>	1099	Teaching prospective mathematics teachers to solve non-routine problems <i>Ildar Safuanov</i>
996	Assigned to creativity: Didactical contract negotiation and technology <i>Valérie Émin, Nataly Essonnier, Pedro Lealdino Filho, Christian Mercat and Jana Trgalová</i>	1101	Process-based analysis of mathematically gifted pupils in a regular class at primary school <i>Stefanie Winkler and Matthias Brandl</i>
1003	Mathematicians' views on undergraduate students' creativity <i>Gulden Karakok, Milos Savic, Gail Tang and Houssein El Turkey</i>	1103	TWG08 AFFECT AND MATHEMATICAL THINKING
1010	Teachers of the mathematically gifted: Two case studies <i>Alexander Karp and Vasily Busev</i>	1104	Introduction to the papers of TWG08: Affect and mathematical thinking <i>Pietro Di Martino, Inés Ma Gómez-Chacón, Peter Liljedahl, Francesca Morselli, Marilena Pantziara and Stanislaw Schukajlow</i>
1016	Mathematical creativity or general creativity? <i>Maria Kattou, Constantinos Christou and Demetra Pitta-Pantazi</i>	1108	Research papers
1024	Creativity and expertise: The chicken or the egg? Discovering properties of geometry figures in DGE <i>Roza Leikin and Haim Elgrabli</i>	1109	'I can – you can': Cooperation in group activities <i>Chiara Andrà, Domenico Brunetto, Nicola Parolini and Marco Verani</i>
1032	Students with hearing impairment: Challenges facing the identification of mathematical giftedness <i>Swetlana Nordheimer and Matthias Brandl</i>	1116	The flow of emotions in primary school problem solving <i>Davide Antognazza, Pietro Di Martino, Aline Pellandini and Silvia Sbaragli</i>
1039	The effect of high versus low guidance structured tasks on mathematical creativity <i>Sonia Palha, Jaap Schuitema, Carla van Boxtel and Thea Peetsma</i>	1123	Turkish prospective middle grades mathematics teachers' teaching efficacy beliefs and sources of these beliefs <i>Okan Arslan and Aykut Bulut</i>
1046	Visual processing and attention abilities of general gifted and excelling in mathematics students <i>Nurit Paz-Baruch, Mark Leikin and Roza Leikin</i>	1131	Improving children's perseverance in mathematical reasoning: Creating conditions for productive interplay between cognition and affect <i>Alison Barnes</i>
1052	Assessing mathematically challenging problems <i>Demetra Pitta-Pantazi, Constantinos Christou, Maria Kattou, Paraskevi Sophocleous and Marios Pittalis</i>	1139	Analysing teachers' belief system referring to the teaching and learning of Arithmetic <i>Katinka Bräunling and Andreas Eichler</i>
1059	Heuristics and mental flexibility in the problem solving processes of regular and gifted fifth and sixth graders <i>Benjamin Rott</i>	1146	Identity and rationality in group discussion: An exploratory study <i>Laura Branchetti and Francesca Morselli</i>
1066	Designing tasks for mathematically talented students <i>Maike Schindler and Julia Joklitschke</i>	1153	Invented or discovered? <i>Eleni Charalampous</i>

1160	Discursive positionings and emotions in a small group's learning of geometric definitions <i>Wajeeh Daher, Osama Swidan and Juhaina Shahbari</i>	1294	Emma's mathematical thinking, problem solving and affect <i>Hanna Viitala</i>
1167	The mathematics teacher: An emotional rational being <i>Marina De Simone</i>	1301	Investigating sources of pre-service teachers' self-efficacy for preparing and implementing mathematical tasks <i>Bilge Yurekli, Mine Isiksal and Erdinc Cakiroglu</i>
1174	How a local oral examination considers affective aspects of knowing mathematics <i>Anne Birgitte Fyhn</i>	1308 Posters	
1181	Students' emotional experiences in high school mathematics classroom <i>Gustavo Martínez-Sierra</i>	1309	Teachers' perspective on group dynamics <i>Chiara Andrà, Domenico Brunetto, Nicola Parolini and Marco Verani</i>
1188	Mathematics teachers in preservice teachers' metaphors <i>Çiğdem Haser, Okan Arslan and Kübra Çelikdemir</i>	1311	Attitudes of secondary school students towards work in learning situations <i>María del Socorro García González and Rosa María Farfán Márquez</i>
1195	Basic emotions of primary school pupils in mathematics lessons <i>Ineta Helmane</i>	1313	Formative scaffolding: How to enhance mathematical proficiency, prevent and reduce mathematics anxiety <i>Annika Grothérus</i>
1202	Development of mathematics-related beliefs scale for the 5 th grade students in Turkey <i>Nermin Kibrislioğlu and Çiğdem Haser</i>	1315	Why mathematics? Students' narratives about failing in compulsory school mathematics <i>Oana Hansson</i>
1209	'Two things I like, maths and chocolate': Exploring ethical hedonism in secondary mathematics teaching <i>Elizabeth Lake</i>	1317 TWG09 MATHEMATICS AND LANGUAGE	
1216	Patterns of motivation and emotion in mathematics classrooms <i>Gareth Lewis</i>	1318	Challenges and research priorities in the context of TWG09: Mathematics and Language <i>Núria Planas, Anna Chronaki, Frode Rønning and Marcus Schütte</i>
1223	Emotions as an orienting experience <i>Peter Liljedahl</i>	1325 Research papers	
1231	"Let's play! Let's try with numbers!": Pre-service teachers' affective pathways in problem solving <i>Francesca Morselli and Cristina Sabena</i>	1326	Reading data from graphs: A study on the role of language <i>Giovannina Albano, Cristina Coppola and Tiziana Pacelli</i>
1238	About Relationships in the Affect Domain <i>Manuela Moscucci and Cecilia Bibbò</i>	1333	Linguistic stratification in a multilingual mathematics classroom <i>Richard Barwell</i>
1245	On the role of affect for sense making in learning mathematics – aesthetic experiences in problem solving processes <i>Eva Müller-Hill and Susanne Spies</i>	1340	Mathematics learning in whole class discussion: A design experiment <i>Kaouthar Boukafri, Miquel Ferrer and Núria Planas</i>
1252	The role of multiple goals in students' motivation and achievement <i>Marilena Pantziara and George N. Philippou</i>	1347	Number words in 'other' languages: The case of little Marram <i>Anna Chronaki, Georgia Mountzouri, Maria Zaharaki and Núria Planas</i>
1259	Affective transgression in learning mathematics <i>Barbara Pieronkiewicz</i>	1354	Vague language and politeness in whole-class mathematical conversation <i>Thérèse Dooley</i>
1266	Teachers' individual beliefs about the roles of visualization in classroom <i>Angela Schmitz and Andreas Eichler</i>	1361	The grammar and conceptualisation of motion in Iwaidja <i>Cris Edmonds-Wathen</i>
1273	Is boredom important for students' performance? <i>Stanislaw Schukajlow</i>	1368	How communicative teaching strategies create opportunities for mathematics learning <i>Margareta Engvall, Joakim Samuelsson and Karin Forslund Frykedal</i>
1280	Promoting cognitive engagement in secondary mathematics classrooms <i>Karen G. Skilling and Gabriel J. Stylianides</i>	1374	Diverse epistemic participation profiles in socially established explaining practices <i>Kirstin Erath and Susanne Prediger</i>
1287	The restricted yet crucial impact of an intervention on pupils' mathematics-related affect <i>Laura Tuohilampi, Liisa Näveri and Anu Laine</i>		

1382	Deictic gestures as amplifiers in conveying aspects of mathematics register <i>Danyal Farsani</i>	1503	Linguistic norms in mathematics lessons <i>Kerstin Tiedemann</i>
1387	The interplay of language and objects in the mathematics classroom <i>Marei Fetzer and Kerstin Tiedemann</i>	1510	Reconstruction of teachers' professional vision concerning important aspects of classroom interaction <i>Anna-Marietha Vogler</i>
1393	Using gaze tracking technology to study student visual attention during teacher's presentation on board <i>Enrique García Moreno-Esteva and Markku S. Hannula</i>	1517	Students' language repertoires for prediction <i>David Wagner, Joseph Dicks and Paula Kristmanson</i>

The flow of emotions in primary school problem solving

Davide Antognazza¹, Pietro Di Martino², Aline Pellandini¹ and Silvia Sbaragli¹

1 SUPSI, Department of Education and Learning, Locarno, Switzerland

2 University of Pisa, Department of Mathematics, Italy, dimartin@dm.unipi.it

Research into if, and how, students' emotions change during problem-solving, the factors behind the change, and the potential impact of a certain emotional change on mathematical activity, may provide significant indications regarding students' problem-solving difficulties, and regarding the link between affective and cognitive factors "in context". In this paper, we describe the results of a pilot study conducted at primary school level, while also emphasising the methodological choices made in relation to the young ages of the students involved.

Keywords: Emotions, problem solving, affect, primary school, mathematics.

INTRODUCTION AND THEORETICAL FRAMEWORK

The role played by the affective factors in the study of the mathematics teaching and learning process has been little explored for a long time. The success of behaviourism in psychology, the clear division between emotions and rational thinking, and the conviction that this latter sphere is particularly predominant in mathematics marginalised research into affective factors in mathematical education until the 1980s. As emphasized by Zan, Brown, Evans and Hannula (2006, p. 113): "affect has generally been seen as 'other' than mathematical thinking, as just not part of it."

In the 1980s, the gradual affirmation of the interpretative paradigm in the social sciences, related to a greater attention to aspects regarding the complexity of human behavior, has led researchers to abandon the attempt to explain behavior through measurements or general rules based on a cause-effect scheme, and to search instead for interpretative tools. Within this approach, the scientific community in M.E. has recognized the need to go beyond purely cognitive

interpretations of failure in mathematics, in particular to interpret the failure of individuals apparently possessing the necessary cognitive resources in mathematical problem solving (Silver, 1985).

In 1989, the book *Affect and mathematical problem solving* by McLeod and Adams opened up a new era in research into emotions in mathematics education. As a matter of fact, the book includes several contributions that, following the theoretical model for the cognitive origin of emotions proposed by the psychologist George Mandler, underline the role of emotion in one of the most important mathematical activities (problem solving). According to Mandler (1989), complex emotions are the result of the cognitive evaluation of a visceral arousal provoked by a discrepancy between the individual's expectations and the demands of ongoing activity.

In the meantime, evidence of the strong interaction between cognitive and affective factors – in particular, of the influence of emotions on decision-making processes – also emerges from studies from other fields of research such as neuroscience (Damasio, 1996) and psychology (Salovey & Mayer, 1990). The study by Salovey and Mayer, introducing the concept of *emotional intelligence*, completely changed the way of looking at the affective component of human personality and its relationship with the cognitive field. Emotions are no longer regarded as a disturbance to correct thinking, but as a potential for effective thinking, particularly when our (and those of other people) affective experiences are recognised and managed appropriately.

On the other hand, according to Mandler (1989, p. 16): "Affectless learning is not a possible goal for a theory or for the praxis of instruction. Common sense tells us that emotions and affective reactions are with us now and forever."

This all leads to the conviction that it is important to teach emotion management in learning, a conviction that is also gaining ground in the mathematics education research field, which confirms how emotions on the one hand affect cognitive processing, biasing attention and memory and activating action tendencies, and on the other have a key role in human coping and adaptation (Evans, 2000; Hannula, 2002). In particular, Op 'T Eynde, De Corte and Verschaffel (2006, p. 194) claim: "from a socio-constructivist perspective, students' emotions and other affective processes are conceived as an integral part of problem solving and learning."

An important objective of mathematics education should therefore be that of teaching how to manage emotional involvement, particularly that which involves negative emotions (Op 'T Eynde, De Corte, & Verschaffel, 2006, p. 204).

Teaching students how to solve mathematical problems then implies that we have to teach them also how to cope effectively with feelings of frustration or sometimes anger. In other words, when teaching and learning mathematical problem solving, the allowing of space for negative emotions might be an educational goal from a cognitive, as well as motivational, point of view. Indeed, only when experiencing negative emotions will students have the opportunity of learning how to deal with them.

The very features of problem solving mean that the process is typified by frequent *interruptions to pre-established plans* and by local failures, which, according to Mandler's model, initiate the emotional experience process. In his overview of the research on emotions in problem solving, Hannula (2012) concludes: "The main lesson to learn from the research on emotions in problem solving is that emotions are an essential part of problem solving."

Mathematical problem solving is therefore often marked by a strong emotional component, which can very rapidly evolve from positive to negative, pleasant to unpleasant, or vice versa, and emotion management profoundly affects students' performances. So, as emphasised by Op 'T Eynde and colleagues (*ibidem*, p. 204) it is very important to conduct further study into these emotions, in order to "become aware of dynamics underlying the succession of several emotions over a short period of time".

The aim of our research was to study these dynamics at primary school level, investigating students' emotions when faced with a mathematical problem, how these emotions change, and the factors that the students recognise as being responsible for the emotions and for the changes.

METHODOLOGY

Population

The study involved five primary school classes in Canton Ticino (Switzerland): one 3rd grade class (18 students), three 4th grade classes (53 students) and one mixed 3rd-4th grade class (20 students), making a total of 91 students.

Rationale

It is very difficult to study emotions: all instruments are limited in capturing emotional reactions that are not conscious (Schlögmann, 2002) and, as Ortony, Clore and Collins claim (1988, p. 9): "There is as yet no known objective measures that can conclusively establish that a person is experiencing some particular emotion." These same authors emphasise how emotions are nevertheless not linguistic things, but the most readily available non-phenomenal access we have to them is through language and we are willing to treat people's reports of their emotions as valid.

In the context of mathematics education it has been shown that it is important to adopt a multiple approach to data collection in the research on emotions (Evans, 2004), and how: "mathematical activity should be studied in context, and that researchers should take an actor's perspective [emphasis in the original] *that allows the meaning structure underlying students' behaviours and emotions to become explicit.*" (Evans, 2006, p. 241)

In order to "take an actor's perspective", we believe that it is important to choose instruments that contemplate open answers, where the respondent is free to express his emotions using his own words; as Cohen and colleagues (2007) underline:

It is open-ended responses that might contain the 'germs' of information that otherwise might not have been caught in the questionnaire (...) An open-ended question can catch the authenticity, richness, depth of response, honesty and candor which are the hallmarks of qualitative data.

On the other hand, the low number of mathematics education studies on the emotions of “young” students (primary school) is probably due to the difficulties experienced by the students in terms of possessing and managing the “language of emotions”. This is precisely why an important item of our research was an emotional literacy course conducted by Antognazza and Sciaroni (2010) in the classes participating in the research project, aimed at the allowing students to acquire an understanding of their emotions, and also to learn a specific vocabulary for clearly expressing which emotions they are experiencing at a specific time.

Procedure

There were three phases to our study:

1) **A pre-test** conducted on some pilot classes in order to assess, on the one hand, if the mathematics problems tested were calibrated, and to what extent (i.e. the average level of difficulty for the students), and, on the other hand, to identify a codification protocol for analysing the open-answer questions.

The questionnaire used in the research, and the codification protocol, were defined at the end of this phase, and six problems were identified as appropriate to the research objectives. The texts of the problems were shown to the class teachers, who were asked to choose one that they considered to have the *correct* level of difficulty for their students: neither too easy nor too difficult. One example was: “Giulio and Andrea play together with their toy cars. They have a total of 48 cars to play with. At the end of the game, they each take back their own cars. Andrea has three time as many cars as Giulio. How many cars does Andrea have at the end of the game? How many cars does Giulio have at the end of the game?”

2) **An activity phase.** The students were asked to read the selected problem on their own, to answer the questionnaire tested in phase 1, and, subsequently, to try to solve the problem. No time limit was given. This phase was conducted individually in school workplaces in which the students felt comfortable (class, creative activity laboratory or support class).

The questionnaire given to the students consisted of three questions investigating three aspects:

- a) assessment of the difficulty of the problem. Closed-answer question “*how do you evaluate the problem?*” with the following possible alternative answers: easy, quite easy, medium, quite difficult, difficult;
- b) expression of the emotion perceived when having to solve the problem. Open-answer question: “*how do you feel about having to solve this problem?*”;
- c) identification of the reasons underlying the perception of the emotion expressed: Open-answer question: “*Why do you think you feel like this?*”.

3) **Semi-structured individual interview** (transcribed), focussing on the emotional states experienced when solving the problem, any changes from the emotion initially expressed (“*On the paper you wrote that you were [emotion written down]. Did you feel any other emotions when you were solving the problem?*”), and the reasons for these changes (“*Why did your emotion change? What happened?*”).

The students were observed while they were solving the problem, in order to analyse their behaviour and their facial expressions. This observation took place under conditions of experimenter blindness (the experimenter did not know how the students had answered the questionnaire), and was also useful in terms of allowing specific questions to emerge in the course of the individual interviews.

RESULTS AND DISCUSSION

A priori assessment of the difficulty of the problem

An analysis of the questionnaire showed how, after having read the text, most students effectively classified the set problem as “quite easy” or “medium” (see Table 1 below).

A priori assessment of the difficulty of the problem	Easy	Quite easy	Medium	Quite Hard	Hard
Percentage	12%	43%	31%	12%	2%

Table 1: A priori assessment of the difficulty of the problem

Emotion perceived from reading the text

Analysis of the answers to the second question – open-ended and fluid responses – is more complex. On the one hand the positive/negative emotion dichotomy must be defined, while on the other hand it is necessary to identify the “representatives” in order to categorise various labels that appear to take inspiration from similar emotions.

According to Ortony and colleagues (1988), emotions are considered as “valenced reactions” to consequences of events, action of agents, or aspects of objects, and then it is possible to classify the reactions to events as being pleased or displeased, the reactions to agents as approving or disapproving, and those to objects as liking or disliking. These dichotomies permitted a first classification of emotions into positive and negative.

In terms of identifying the representatives, the codification protocol developed following the pre-test phase was utilised, making it possible to identify 6 categories consisting of 3 dichotomous pairs: *confident, worried, nervous, calm, happy, sad*, to which, a posteriori, was added the category *bored*, not found in the answers obtained in the pre-test. We emphasise that the answer was open, without any kind of restriction and with the possibility for the students to specify more than one emotion.

Table 2 summarises the quantitative results obtained.

Some interesting observations: the emotions initially stated, and supported by the subsequent interviews, are essentially perfectly divided into “positive” and “negative”, but although this equilibrium is also found in the specific nervous/calm dichotomy (22% vs 20%), “worried” appears to predominate over “confident” in terms of the possibility of solving the problem, and “happy” appears to predominate over “sad” in terms of having to tackle the problem.

Another significant aspect consists of the fact that the balance between positive and negative emotions obtained from the sample of the five classes is less strong when analysing the individual classes involved in the study. For example, the 3rd grade class is typi-

fied by positive emotions selected by 17 out of 18 students (10 students express happiness, and 7 students express calmness), while in other classes negative emotions predominate. For example, in one of the 4th grade classes, consisting of 17 students, the following emotions were expressed: worry (6 students), nervousness (3 students) and sadness (2 students). This may depend partly on cognitive aspects such as superior competence, but also on affective aspects, such as conviction in one’s own understanding regarding the specific problem, and on other aspects (emotions, convictions, attitudes and values) depending on the specific social context of the class: “students’ interpretation and appraisals processes that initiate the emotional process are grounded in a specific context” (Op ‘T Eynde & et al., 2006, p. 196).

As a qualitative note to the analysis of the second question of the questionnaire, we emphasise that in three cases the students’ answers testify contrasting emotions. In one of these cases, Enea states testifies between the fear of not knowing how to solve the problem (“*a little scared*”) and his confidence in his own abilities, or, in any case, the desire to muster his courage (“*but I’m sure that I can do it*”). In the other two cases, the contrasting emotions are associated with various aspects: *intrinsic*, in the sense of being related to the specific problem, and, *extrinsic*, in the sense of being extraneous to the specific problem. Martina appears worried about having to solve the problem of the toy cars (“*I am in a little bit of difficulty because I can’t find the calculation*”), but at the same time she notes that she feels fine as she always does in class (“*I feel good, like in class*”). On the other hand, Mattia feels nervous because, as he later explains in the interview, he always feels nervous when he has to solve problems, but he feels relatively calm about the toy cars problem.

Correlation between the perception of the difficulty of the problem and the emotion stated

Most of the students who state that they think that the problem is easy/quite easy feel calm or happy; on the other hand, those who think that the problem is quite difficult/difficult feel worried or nervous. Out

Emotion	Confident	Worried	Nervous	Calm	Happy	Sad	Bored	Other
Percentage	7%	18%	22%	20%	22%	2%	8%	1%

Table 2: Emotions associated with the problem

of 91 students, only 13 do not assign positive emotions to presumed ease, or negative emotions to presumed difficulty.

Analysing the answers to the third question (the reasons for the emotions), these 13 students are seen to divide into two “categories”. The first category consists of those who, in a certain sense, show that they appreciate the “intellectual challenge” of the mathematics problem (usually good-achievers) and for whom the easy problem is boring (Chiara: “*I feel bored because it's boring when problems are easy*”), and the difficult problem a real challenge (Irene, who thinks that the problem is difficult, writes: “*The emotion that I feel is joy because the problem is nice*”). The second category consists of those who, like Mattia cited above, say that they feel nervous when they have to solve mathematics problems, and although they think that the toy cars problem is easy, are overcome by what we might call a worry consistently associated with having to tackle mathematics. This is a very interesting phenomenon, in terms of both research on affect in mathematics education, and in terms of didactics. In fact, it is precisely when aversion, worry and fear are experienced *regardless* of the intrinsic aspects that a negative attitude of fatalism toward mathematics can develop, an attitude which is very difficult to modify (Zan & Di Martino, 2009).

Causes of the declared emotions

More generally, when analysing the causes of the declared emotions (question 3 of the questionnaire), the aspect we found most interesting was that of distinguishing between reasons referring to the specific problem (*intrinsic*) and reasons not referring to the specific problem (*extrinsic*).

If we consider only the explicit references to intrinsic or extrinsic aspects – not classifying in either sense statements difficult to interpret, such as “*I feel nervous because I am afraid of making a mistake*”: the fear of making a mistake might be associated with doing mathematics (extrinsic) and unrelated to the specific problem, or, on the other hand, it might be associated with the assessment of the level of difficulty of the problem to tackle (intrinsic) – what emerges from the positive/negative emotions dichotomy appears to be rather significant. In fact, the positive emotions are motivated mainly by intrinsic aspects (for example “*because it's easy*”): 56% of those who said they felt happy, 62% of those who said they felt calm, and as much

as 86% of those who said that they felt confident. The negative emotions are motivated mainly by extrinsic aspects (for example “*because I don't like doing problems*”, “*because I don't like mathematics*”, “*because I don't like school*”): 58% of those who said that they felt worried, 67% of those who said that they felt nervous, and more than 86% of those who said that they felt bored.

It should also be noted that the 54% of the students who said that they felt nervous, and the 45% of those who said that they felt worried, highlight the fear of making a mistake or the desire to do everything correctly (for example: “*because I worry about making mistakes*”; “*I don't like them. And if I get them wrong, how will I manage when I'm big*”; “*because I don't know if I do it all correctly*”; “*I think that it's because I don't know if the problem is right or wrong*”). This phenomenon is particularly significant because fear of making errors often becomes fear of math, a phenomenon that has serious consequences on mathematics learning (Di Martino & Zan, 2013).

Change in emotions perceived while solving the problem

One particularly interesting feature from what has been observed until now emerges from the interviews: most of the sample (52%) reports emotional changes from the *initial state*. Those who say that they did not experience any emotional changes are mainly those who started with a positive emotion that was confirmed in the course of the problem-solving process, or else those who started with a negative emotion, associated with extrinsic aspects, an emotion that affected their perseverance in trying to solve the problem. This confirms the link between negative emotions associated with extrinsic aspects and poor perseverance (Hannula, 2012).

The following observations emerge from an analysis of the interviews conducted with those who stated that they experienced emotional changes:

i) **changes in ‘intensity’** (8%, only one case with positive emotions and 6 starting from negative emotions), like that reported by Chiara, who initially said that she felt worried because after having read the problem she thought she would not manage to finish it, but who in the interview explained that at a certain point she stopped feeling worried and became “*almost desperate, because already I didn't manage to finish it, and then,*

seeing all these calculations ...”, or like Martino, who said that he felt happy during the solving process *“because I realised that the calculation wasn’t so difficult”*;

ii) **changes in ‘direction’**: from positive to negative emotion (25%) (like Samuele, who initially said that he felt happy, but who in the interview explained that he felt worried *“because I was trying to do the calculation but I didn’t manage”*), and from negative to positive emotion (14%) (like Selene, who said that she felt worried because she felt alone, but who at the end said that she felt happy because she hoped to have solved it correctly and because *“I feel I did it correctly”*). Moreover, 5% of the students expressed a double change in “emotional direction” while solving the problem: for example, Sofia said at first that she felt calm, then nervous *“because I was afraid of making a mistake”*, then calm again because *“it seemed easy to do”*. Sofia’s account demonstrates a repeated assessment of the situation and of any progress made, and, in particular, this testifies the fact that her emotions are (also) associated with intrinsic aspects.

In both cases (changes in intensity and in direction) it is seen how, except in very rare cases, when explaining the emotional change reference is virtually always made to intrinsic aspects, to the perception of making, or not making, progress in solving the problem. This confirms the close link between affective and cognitive aspects: in fact, a fundamental role is played by convictions about making (or not making) progress toward solving the problem, about having solved the problem correctly or not, convictions that are profoundly linked to the mathematical knowledge of the students. In relation to this, and as an important comment, it is interesting to observe how many of those who changed from a negative to a positive emotion because they were sure that they had solved the problem correctly, in fact handed in a wrong solution to this problem. It would be interesting to investigate the emotion triggered off by discovering that the solution handed in, and believed to be correct, was in fact wrong.

CONCLUSION

In the analysis of the results we have focussed particularly on what we feel is the most interesting aspect of our study, in terms of both research and didactic practice. That is, the distinction between positive or negative emotions perceived in a specific mathemat-

ics problem solving activity and deriving from an assessment of the difficulty of the activity proposed (intrinsic aspects), or from more general aspects (for example, the stance of those who think “I don’t like mathematics, you are asking me to do maths and I therefore have a negative emotion”).

What clearly emerges is that most of those who express a positive emotion on finding out that they have to solve the problem in fact refer to intrinsic aspects, and the issue is therefore one of problem assessment. Conversely, most of those who express a negative emotion refer to aspects unrelated to the problem, or, in other words, to extrinsic aspects (except for the fact that it is recognised as a mathematics problem).

On the one hand this confirms how, already at primary school level, there is a generalised type of “a-priori” hostility towards all things mathematical, hostility that is very often typical of an unquestionable negative attitude toward mathematics (Di Martino & Zan, 2011). On the other hand it suggests the importance of working with students so that any negative attitudes of this type do not compromise the a-priori cognitive assessment of the mathematical activities to be tackled, and the resulting performance. In fact, the negative effects of this kind of phenomenon are clear: negative emotions associated with any mathematics-related activities, deciding against investing the cognitive resources required in order to tackle the activity.

However, the results of our study tell us something more: emotional changes (intensity and direction) during the problem solving activity occur almost exclusively as a result of considerations related to intrinsic aspects. These emotional changes appear to be fundamental in problem solving activities: both those “in the positive direction” (they play an important role in problem-solving perseverance), and those “in the negative direction” (they have an important function in terms of cognitive control stimulation).

Further investigation into the link between emotional change during problem solving, and aspects as perseverance and the activation of cognitive controls would certainly constitute an interesting research direction. It definitely appears that it may be important to promote emotional literacy and emotional awareness, also in order to develop problem solving skills already at primary school level. Our research

also shows how, at the same time, it is fundamental to develop the “proper mathematical understanding”: in our experiment we have shown how many of the positive direction emotional changes were related to the erroneous conviction of having solved the problem correctly.
